

Production network across monetary regimes — Pareto $\gamma = 1.5$, $N = 10$, $M = 20$ /stage (topology regime-invariant; x-axis = $\sum_{m \leq n} t_m^*$; node area $\propto R_{i,n}$)
 Steady state — perpetual-youth, no monetary friction
 $r = 0.0125$ $w = 0.662$ $y_N = 0.882$ $t_{n \geq 2}^* = 16.12$ chain length = 169

Boom — Phase 2(a) at $\theta = 0.04$ (naive Fisher, no asset-market clearing)
 $r = 0.0050$ $w = 0.871$ $y_N = 1.160$ $t_{n \geq 2}^* = 40.20$ chain length = 422

Bust — Phase 2(d) at $\theta = 0.04$ (wedge ϕ enforces $K^d = K^s$)
 $r = 0.0150$ $w = 0.627$ $y_N = 0.835$ $t_{n \geq 2}^* = 13.44$ chain length = 141 $r_H = 0.0050$ $\phi = +0.0100$
